PROJECT EXECUTABLE FILES

Project Name: EduGenie

Project Type: AI-Powered Learning Assistant

Technology: Google Gemini Generative AI

1. INTRODUCTION

The Project Executable Files section contains the files and resources required to run and demonstrate the EduGenie application.

These files provide the necessary components for executing the project and verifying its functionality.

2. PROJECT FILES

The EduGenie project consists of the following important files and components:

- Main application source file
- AI / Gemini integration code
- User interface components
- Configuration files
- Dependency or requirements file
- Supporting project files
- Documentation files

3. MAIN APPLICATION

The main application file is responsible for starting and running the EduGenie system.

It connects the user interface, application logic, and AI functionality to provide the required learning assistance.

4. GOOGLE GEMINI INTEGRATION

The Gemini integration component connects EduGenie with Google Gemini Generative AI through the Gemini API.

It is responsible for:

- Sending user requests to the AI service.
- Processing the generated response.
- Returning the response to the application.

5. DEPENDENCY FILES

The project includes the required dependencies and libraries needed to run the application.

A dependency or requirements file can be used to identify the libraries required by the project.

The required dependencies should be installed before running the application.

6. CONFIGURATION

The project requires appropriate configuration for connecting to the Gemini API.

API credentials should be stored securely and should not be exposed publicly or included directly in publicly shared source code.

7. EXECUTION PROCESS

The general execution process is:

Step 1:

Open the EduGenie project.

Step 2:

Install the required dependencies.

Step 3:

Configure the required Gemini API credentials securely.

Step 4:

Start the main application.

Step 5:

Enter educational content or a question.

Step 6:

Submit the request.

Step 7:

EduGenie communicates with Google Gemini.

Step 8:

The generated response is displayed to the student.

8. EXECUTABLE PROJECT CONTENT

The final project submission should contain:

- Complete source code
- Required dependency files
- Configuration instructions
- Gemini API integration
- User interface components
- Supporting resources
- Documentation
- Demonstration materials

9. EXECUTION REQUIREMENTS

The following are required for running EduGenie:

- A computer or laptop
- Supported programming environment
- Internet connection
- Required software dependencies
- Valid Gemini API configuration

10. VERIFICATION

Before final submission, the executable project should be verified to ensure that:

- The application starts successfully.
- The user interface works correctly.
- User input is accepted.
- Gemini API communication works correctly.
- AI-generated responses are displayed.
- Common errors are handled properly.
- The major project features are functional.

11. PROJECT DELIVERY

The final executable project should be organized clearly so that another person can understand the required files and run the application with minimal setup.

All necessary source files, dependencies, configuration instructions, and documentation should be included in the final project submission.

12. CONCLUSION

The Project Executable Files section provides the resources required to run and verify the EduGenie application.

A properly organized executable project makes it easier to demonstrate the functionality of EduGenie and ensures that the project can be maintained and extended in the future.
